

2008 Harrington Factory Training Information

Harrington Signal Certification Training Classes on its Addressable Fire Alarm Control Panels is one of the many value-added services provided by Harrington Signal. ESD's must attend a Factory Level "A" Training class to earn or maintain their Level "A" Certification. The 2 or 4 day class will be held each quarter at the factory in Moline, Illinois.

ESD Factory Training is an opportunity for ESD Technicians to gain expertise and certification while working directly with the factory technicians. The interactive "A" class provides hands-on training for our P110 & T8000 FACP's and/or HS-3030 & HS-3100/HS-3200 FACP's.

Certification is earned upon successful completion of the class, labs and testing. Each student receives a set of training manuals of material covered in the class as well as a copy (on CD) of our latest release for their company's use. Students are required to bring laptops (XP or older operating systems) so that Harrington Signal's Technical Service staff can ensure that equipment is fully operational and students are ready for the next Harrington Signal system they install.

ESD'S Please Note: The certification is in the name of the person who is certified, if the person leaves your employment, you will be required to send another person to keep your company's Harrington Signal Level "A" certification (just like many State Licenses).

Harrington Signal will be offering two 2 day classes each quarter, with the first 2 days covering the P110 and T8000 FACP's and the second 2 days covering the HS-3030 and HS-3100/3200 FACP's.

If you have any questions please call Harrington Signal and ask for Steve Schilb in our Technical Service Department - 800-577-5758 ext. 239.
